

In the Specification

At page 39, lines 1-14:

[133] Production of the identification document 100 document begins at the Imaging System 505, where card substrates, such as preprinted TESLIN sheets 516, are fed into the back printer 508. The back sides of the TESLIN sheets 516 can be customized with desired information (e.g., restriction codes or other information unique to each document on the sheet). In addition, bar codes for tracking the documents through the production process can be added. As the TESLIN sheet enters the second section of the Imaging System 505, the front printer 510 prints appropriate portrait and signature images on the front of the documents based on personalized cardholder information stored in a file. The front printer 510 also prints the interlaced images (which, in one embodiment, comes from an interlaced image file accessible to the laminator/die cutter controller 553) on the front of the TESLIN sheets 516. Note that since a plurality of identification documents 100 documents are being produced simultaneously, the front printer 510 can print ~~an~~ one or more indicia for each document onto the appropriate locations of the TESLIN sheets 516. The outputs[output] of the front printer 510 are document sheets 550 printed on the front and back.
